Li, Ruixiang Tuesday, April 16, 2002 4:13 PM STIC-Biotech/ChemLib Sequence search of Application NO: 09/758,593

Please do a standard search of SEQ ID NOs: 1 and 2 against both the commercial and interference nucleic acid databases.

Thank you very much!

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this gequence record is arbitrary. Gaps between the contigs are represented as runs of N but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 15 contigs. The true order of the pieces is is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Wang D;

```
the invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinhibin activity, chemotactic/chemokinetic activity, hemocactic/chemokinetic activity, hemocactic/chemokinetic activity, arthritis and inflammation; leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                C.N.S disorders.
Note: The sequence data for this patent did not form part of the printed

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and system, such as peripheral nervous injuries, peripheral neuropathy and alrheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed

```
The present invention provides the protein and coding sequences of a number of human shear stress response proteins. These are useful in the diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA sequences, proteins encoded by them and antibodies against them useful in diagnosis and treatment of vascular disease caused by arteriosclerosis -

C.N.S disorders.

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activity the activity chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Wang D;
                                                                                                                                                                                                                                                Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ren F, W

the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferation, hypothyroidsm, cholesterol ester storage, systemic lupus hypertension, hypothyroidsm, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuaia, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human tankyrase; TRF1; telomeric repeat binding factor-1; telomere length regulation; recombinant tankyrase; aging; skin atrophy; macular degeneration; atherosclerosis; ataxia telangiectasia; tankyrase modulator; rational drug design.

                                                                                                                                                                                                                                                                                                                                                            6
                                                                                                                                                The present sequence is truncated human tankyrase, a TRF1 (telomeric repeat binding factor-1) binding protein. This comprises 1-881 residues of human tankyrase. Tankyrase is involved in regulation of telomere length through TRF1 and may directly modulate the effect of TRF1 Recombinant tankyrase, or its fragments are used to identify specific modulators which are potential drugs for countering telomere shortening associated with adjing (e.g. atrophy of skin, macular degeneration or atherosclerosis) or diseases like ataxia telangiectasia. They are also used to raise specific antibodies (used as immunoassay reagents and as modulators of tankyrase activity) and in rational drug design.
                                                                           New nucleic acid encoding vertebrate tankyrase, a regulator of telomere length, used to identify modulators, e.g. for inhibiting growth of

The present sequence is a version of the human tankyrase I protein sequence. The invention relates to the isoaltion of the protein and coding sequences of human tankyrase II. This protein is thought to be involved in signal transduction in the cell, and to have binding activity for other telomere-associated proteins. It is possible that it plays a role in the regulation of telomere length, thus affecting the replicative ability of the cell. The protein is useful for ribosylating target proteins, for determining tankyrase II binding activity in a sample, and for modulating telomere length in a cell.
                                                                                                                                                                                                                                                                               Novel mammalian Tankyrase II polypeptide and the polynucleotide encoding the polypeptide useful for modulating or maintaining telomere length, replicative capacity, apoptosis, chromosome packing or gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      195 HLEVVKLLQSHGADTNVRDKLLSTPLHVAVRTGQVEIVEHFLSLGLEINARDREGDTALH 254

This was isolated using a two-hybrid screen with TRF1. Tankyrase is involved in regulation of telomera length through through threatly modulate the effect of TRF1. Recombinant tankyrase, or its fragments are used to identify specific modulators which are potential drugs for countering telomere shortening associated with aging (e.g. atrophy of skin, macular degeneration or atheroscolerosis) or diseases like ataxia telangiectasia. They are also used to raise specific antibodies (used as immunoassay reagents and as modulators of tankyrase activity) and in rational drug design.

The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRFI, which is a telomere-specific binding protein. The regulation of telomere length, in which fRFI has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       qqilsestpirtsdvdyrlleaskagdletvkqlcssqnvncrdlegrhstplhfaagyn 695

SPANK is a cytosolic protein which can poly(ADP-ribosyl)ate itself.
SPANK binds insulin-responsive aminopeptidase (IRAP) and modulates
translocation of GLUT4 in the perinuclear region of adipocytes. It

is an effector in the insulin signalling pathway in eukaryotic cells. SPANK is useful for reducing body mass, reducing glucose intolerance or insulin resistance, for preventing or treating obesity. related diseases or disorders, such as obesity, cardiac insufficiency, coronary insufficiency, stroke, hypertension atheromatous disease, atherosciencis, high blood pressure, non-insulin dependent diabetes, hyperlipideemia, hyperuricemia and Syndrome X and is also useful for preventing or treating muscle-related diseases or fatigue. Antibodies immunospecific for SPANK are useful for detecting the presence of SPANK polypeptide in a biological sample.
